### E06 Queries on KB

16337188 Ouyang Runyu

October 12, 2018

#### Contents

#### 1 Problem Description

Given a KB Restaurants.pl, which describes the distribution of branches of 10 well-known restaurants in Guangzhou.

For example, restaurant (ajukejiacai, 2007, yuecai) means that ajukejiacai was founded in 2007 and is a restaurant of yuecai. branch(ajukejiacai, xintiandi) means that ajukejiacai has a branch in xintiandi. district(xintiandi, panyu) means that xintiandi is an area of panyu district.

Please formulate each of the following questions as a query using Prolog's notation, pose it to Prolog, and obtain Prolog's answer:

- 1. What restaurants have branches in beigang?
- 2. What districts have restaurants of yuecai and xiangcai?
- 3. What restaurants have the least number of branches?
- 4. What areas have two or more restaurants?
- 5. Which restaurant has the longest history?
- 6. What restaurants have at least 10 branches?

Please define the new relation below using Prolog and test it.

• sameDistrict(Restaurant1, Restaurant2): Restaurant1 and Restaurant2 have one or more branches in the same district.

You should write down a listing that shows the queries you submitted to Prolog, and the answer returned. Hand in a file named E06\_YourNumber.pdf, and send it to ai\_2018@foxmail.com

#### 2 Codes and Results

- You can see the codes in myRestaurants.pl.
- You can see the answer in myQueries.txt.
- The following codes are added in the given Restaurants.pl.

```
\label{eq:control_control_control_control_control_control_control_control_control_control_control_control_control_control_control_control_control_control_control_control_control_control_control_control_control_control_control_control_control_control_control_control_control_control_control_control_control_control_control_control_control_control_control_control_control_control_control_control_control_control_control_control_control_control_control_control_control_control_control_control_control_control_control_control_control_control_control_control_control_control_control_control_control_control_control_control_control_control_control_control_control_control_control_control_control_control_control_control_control_control_control_control_control_control_control_control_control_control_control_control_control_control_control_control_control_control_control_control_control_control_control_control_control_control_control_control_control_control_control_control_control_control_control_control_control_control_control_control_control_control_control_control_control_control_control_control_control_control_control_control_control_control_control_control_control_control_control_control_control_control_control_control_control_control_control_control_control_control_control_control_control_control_control_control_control_control_control_control_control_control_control_control_control_control_control_control_control_control_control_control_control_control_control_control_control_control_control_control_control_control_control_control_control_control_control_control_control_control_control_control_control_control_control_control_control_control_control_control_control_control_control_control_control_control_control_control_control_control_control_control_control_control_control_control_control_control_control_control_control_control_control_control_control_control_control_control_control_control_control_control_control_control_control_control_control_control_control_control_control_control_control_control_control_control_co
```

- The following are the results
- 1. What restaurants have branches in beigang?

### ?- setof(A, branch(A, beigang), Res). Res = [huangmenjimifan, mixuebingcheng, shaxianxiaochi].

- 2. What districts have restaurants of yuecai and xiangcai?
- ?- setof(A, (restaurantDistrict(yuecai, A), restaurantDistrict(xiangcai, A)), Res).
  Res = [haizhu, liwan, panyu, tianhe, yuexiu].

3. What restaurants have the least number of branches?

# ?- findall(A, lessBranch(A, 0), Res). Res = [hongmenyan].

- 4. What areas have two or more restaurants?
- ?- setof(A, calArea(A), Res).

Res = [bainaohui, beigang, dongpu, shiqiao, tianhebei, xintiandi, yongfu, yuancun].

5. Which restaurant has the longest history?

## ?- setof(A, longerHistory(A, 0), Res). Res = [huangmenjimifan].

- 6. What restaurants have at least 10 branches?
- ?- setof(A, calBranch(A), Res).

Res = [dagangxianmiaoshaoji, diandude, mixuebingcheng, muwushaokao, tongxianghui].
